

Data management for multilevel analysis

Importing and aggregating
Centering and standardizing

Dimitri Mortelmans
Centre for Longitudinal and Life Course Studies (CLLS)
University of Antwerp

OVERVIEW

- **At cluster level (country level)**
 - Importing external data
 - Aggregating internally (or externally)
- **At the individual level**
 - Dichotomizing

0. Converting the ESS- variable **centry**

Turning **centry** into a numeric variable

* 0.1 Sorting and creating a new numeric country-variable.

* -----

SORT CASES BY centry(A).

AUTORECODE VARIABLES=centry

/INTO centry2

/PRINT.

* Checking the result.

FREQUENCIES VARIABLES=centry centry2.

Overview of the ML data management

What sorts of questions might arise when preparing your data for a multilevel-analysis ?

Overview of ML data management

- Type 1 = creating raw variables
- Type 2 = centering and standardizing

Overview of ML data management

- **Type 1 = Creating raw variables**

- Creation at level 1

Usually unnecessary because they are already in your dataset.

- Creation at level 2

EITHER Searching external meta-data and import them

(E.g. BNP_PPS of BNP)

OR Aggregate internally

(bringing variables in your dataset from level 1 to level 2)

(E.g. % Catholics or Mean Religiosity)

Overview of ML data management

- **Type 1 = Creating raw variables**

- Aanmaken op level 2

	EXTERNALLY	INTERNALLY
Level 2	1. Looking for data in other data sources and importing them in SPSS	2. 2.1 Aggregating ordinal and nominal variables with % 2.2 Aggregating interval variables with mean
Level 1		3. 3.1 Dichotomizing ordinal and nominal variables

Overview of ML data management

- **Type 2 = Centering and standardizing raw variables**
 - All variables in your multilevel model need to be **centered**.
(exception = dummies)
 - All variables in your multilevel model need to be **standardized** (see step 11).
(no exceptions)

Data management at the country level

TYPE 1: Creating raw variables at level 2

1. Importing external data

Where to get external data?

- New Cronos – Eurostat
 - <http://europa.eu.int/newcronos/>
- Statistics Division - United Nations
 - <http://unstats.un.org/unsd/databases.htm>
- Data and Statistics - IMF
 - <http://www.imf.org/external/data.htm>
- Data Centre - UNESCO
 - http://stats.uis.unesco.org/unesco/TableViewer/document.aspx?ReportId=143&F_Language=eng
- Max Planck Institute for Demographic Research
 - <http://www.demogr.mpg.de/databases/cdb/>

Data in the example: New Cronos

GDP per capita in PPS

GDP per capita in Purchasing Power Standards (PPS) (EU-27 = 100)

Please be aware that this indicator has been rescaled, i.e. data is expressed in relation to EU-27

Gross domestic product (GDP) is a measure for the economic activity. It is defined as the Standards (PPS) is expressed in relation to the European Union (EU-27) average set to eq PPS, i.e. a common currency that eliminates the differences in price levels between countries = 100, is intended for cross-country comparisons rather than for temporal comparisons.

[For more information...](#)

Adding the meta data to your dataset

* ALWAYS sort your data before you merge !.

```
DATASET ACTIVATE ess1e05_1.
SORT CASES BY cntry2(A).
```

```
GET FILE=C:\ESS\landvars1.sav'.
DATASET NAME landvars1 WINDOW=FRONT.
SORT CASES BY cntry2(A).
```

* THEN you start to merge.

```
DATASET ACTIVATE ess1e05_1.
MATCH FILES /FILE=*
  /IN=Control_1
  /TABLE='C:\ESS\landvars1.sav'
  /IN=Control_2
  /BY cntry2.
EXECUTE.
```

```
VARIABLE LABELS Control_1 " Record comes from the original ESS-file "
  / Control_2 " Record comes from the external landvars-file".
```

Adding the meta data to your dataset

* ALWAYS sort your data before you merge !.

```

DATASET ACTIVATE ess1e05_1.
SORT CASES BY cntry2(A).
    
```

Always sort first !
otherwise, the BY does not work

```

GET FILE='C:\ESS\landvars1.sav'.
DATASET NAME landvars1 WINDOW=FRONT.
SORT CASES BY cntry2(A).
    
```

* THEN you start to merge.

```

DATASET ACTIVATE ess1e05_1.
    
```

```

MATCH FILES /FILE=*
    
```

```

/IN=Control_1
    
```

Make a new variable that checks from which dataset each record comes from.

```

/TABLE='C:\ESS\landvars1.sav'
    
```

```

/IN=Control_2
    
```

```

/BY cntry2.
    
```

The cntry2-variable is used as an ID-variable between the two datasets.

```

EXECUTE.
    
```

```

VARIABLE LABELS Control_1 "Record comes from the original ESS-file "
                  / Control_2 "Record comes from the external landvars-file".
    
```

Adding the meta data to your dataset

* Checking the merge-routine;

```

CROSSTABS /TABLES=Control_1 BY Control_2.
    
```

Possible form of the table "Control_1* Control_2".

		Control_2	
Control_1		0	1
0	The record comes from neither of the two datasets	The record comes from landvars1 and not from ESS	
1	The record comes from ESS and not from landvars1	The record comes from landvars1 and ESS.	

Adding the meta data to your dataset

* Checking the merge-routine;
CROSSTABS /TABLES=Control_1 BY Control_2.

Possible form of the table "Control_1* Control_2".

Control_2
Control_1

	1
1	N

This means that each country in LANDVARS was correctly merged with the countries in ESS.

Adding the meta data to your dataset

Record comes from the original ESS-file * Record comes from the external landvars-file Crosstabulation

Count

		Record comes from the external landvars-file	
		1	Total
Record comes from the original ESS-file	1	42359	42359
Total		42359	42359

2. Aggregating internally

2.1 Aggregating categorical variables

2.2 Aggregating interval variables

TYPE 1: Creating raw variables at level 2

2.1 Aggregating categorical variables

* A. Percentage of Roman Catholics in a country.
* (Example of aggregating a categorical variable in a data-file).
* Method: Save a table of the variable to the file "freqout".

```
DATASET ACTIVATE ess1e05_1.  
SORT CASES BY cntry2(A).
```

```
OMS SELECT TABLES
```

With OMS, you can divert tables towards a dataset.

```
/DESTINATION format = sav OUTFILE = "C:\ESS\freqout.sav"  
/IF commands = ['Crosstabs'] subtypes = ['Crosstabulation']
```

We will export this table

```
CROSSTABS
```

```
/TABLES=cntry BY RLGDNM  
/CELLS=COLUMN.
```

Cross tabulation from religion and country.

```
OMSEND.
```

2.1 Aggregating categorical variables

Country	RomanCatholic	Protestant	EasternOrthodox	OtherChristian	Jewish	Islam	Easternreligi	OthernonChri	Total
Austria	2.2%	0.2%	0.9%	3.9%	0.2%	3.6%	10.9%	3.0%	5.7%
Belgium	0.7%	0.0%	0.1%	2.6%	0.2%	4.5%	3.9%	6.6%	3.4%
Switzerland	4.3%	7.8%	0.4%	7.1%	0.2%	1.5%	4.7%	13.1%	4.6%

Germany	0.0%	21.7%	0.0%	0.0%	0.0%	0.0%	0.0%	1%	5.6%
Italy	4.5%	0.3%	0.1%	0.0%	0.0%	0.0%	0.0%	0.0%	2.9%
United Kingdom	1.3%	16.4%	0.1%	4.0%	0.5%	4.3%	26.9%	6.0%	3.7%
Greece	0.1%	0.1%	16.2%	0.7%	0.1%	6.5%	0.0%	1.6%	3.9%
Hungary	5.2%	4.1%	0.1%	2.1%	0.1%	0.5%	0.0%	3.9%	3.9%
Ireland	11.4%	0.9%	0.0%	2.6%	0.1%	0.2%	0.0%	0.0%	6.3%
Israel	0.7%	0.0%	0.0%	0.0%	97.0%	44.3%	0.0%	36.4%	0.0%
Italy	6.3%	0.1%	0.0%	0.0%	0.0%	0.0%	0.0%	0.0%	3.4%
Luxembourg	6.9%	0.2%	0.4%	0.0%	0.0%	2.1%	4.7%	2.2%	4.2%
Netherlands	3.3%	6.9%	0.1%	12.9%	0.2%	4.6%	11.7%	2.2%	3.6%
Norway	0.1%	13.8%	0.2%	6.5%	0.0%	2.4%	4.7%	12.9%	3.8%
Poland	12.2%	0.1%	0.0%	1.1%	0.0%	0.0%	0.0%	0.0%	7.2%
Portugal	0.4%	0.2%	0.0%	3.2%	0.1%	0.1%	0.0%	0.0%	4.7%
Sweden	0.1%	7.4%	0.4%	2.9%	0.1%	3.0%	6.2%	3.9%	2.2%
Switzerland	2.5%	0.1%	0.1%	0.4%	0.0%	0.0%	0.0%	0.0%	2.9%
Total	2.5%	0.1%	0.1%	0.4%	0.0%	0.0%	0.0%	0.0%	100.0%

We need to remove this TOTAL-line from the dataset.

From this dataset, we want the percentage of Roman Catholics.

2.1 Aggregating categorical variables

```
GET FILE='C:\ESS\freqout.sav'.
DATASET NAME freqout WINDOW=FRONT.
```

```
FILTER OFF.
USE ALL.
SELECT IF (Var1 = "Country").
EXECUTE.
```

Only keep the cases with the percentages. (= remove the Total-regel underneath the dataset.)

```
SAVE OUTFILE='C:\ESS\freqout.sav'
/DROP=Command_ Subtype_ Label_ Var1 Var3 Protestant EasternOrthodox
OtherChristianDenomination Jewish Islam Easternreligi OthernonChristianreligi Total
/COMPRESSED.
```

Only keep the variables Var2 (=country) and RomanCatholic

```
GET FILE='C:\ESS\freqout.sav'.
DATASET NAME freqout WINDOW=FRONT.
COMPUTE cntry2=$CASENUM.
SAVE OUTFILE='C:\ESS\freqout.sav'.
```

Make a new variable cntry2 based on the case number (= \$CASENUM).

```
* Checking.
SUMMARIZE
/TABLES=cntry2 RomanCatholic
/FORMAT=LIST NOCASENUM .
```

2.1 Aggregating categorical variables

The screenshot shows the SPSS Data Editor window with a dataset named 'Austria'. The data is sorted by the variable 'cntry2'. The columns are 'Var2', 'RomanCatholic', and 'cntry2'. The data points are as follows:

Var2	RomanCatholic	cntry2
1 Austria	9.3%	1,00
2 Belgium	5.7%	2,00
3 Switzerland	4.3%	3,00
4 Czech Republic	2.6%	4,00
5 Germany	4.1%	5,00
6 Denmark	0.1%	6,00
7 Spain	9.0%	7,00
8 Finland	0.0%	8,00
9 France	4.5%	9,00
10 United Kingdom	1.3%	10,00
11 Greece	0.1%	11,00

2.2 Aggregating continuous variables

DATASET ACTIVATE ess1e05_1.

Sort Cases BY cntry.

Always sort first !
otherwise, the BREAK does not work

AGGREGATE

/OUTFILE='C:\ESS\meanout.sav'

Save the mean (for each country) in a new dataset, called *meanout*.

/PRESORTED

/BREAK=cntry2

/RLGDGR_mean=MEAN(RLGDGR).

GET FILE='C:\ESS\meanout.sav'.

The name of the variable with the mean is called *RLGDGR_mean*.

DATASET NAME meanout WINDOW=FRONT.

* Checking.

SUMMARIZE

/TABLES=cntry2 RLGDGR_mean

/FORMAT=LIST NOCASENUM .

2.2 Aggregating continuous variables

cntry2	RLGDGR_mean
1	5,13
2	4,96
3	5,21
4	3,24
5	3,87
6	4,36
7	4,46
8	5,55
9	3,83
10	4,39
11	7,67
12	4,39
13	5,80
14	4,67
15	6,08
16	4,23
17	5,12
18	4,11
19	6,53
20	5,61
21	3,72
22	4,86

All 22 ESS-countries

RLGDGR_mean
(one mean per country)

2.3 Merging both variables into the ESS-dataset

```
DATASET ACTIVATE ess1e05_1.  
SORT CASES BY cntry2(A).  
  
DATASET ACTIVATE freqout.  
SORT CASES BY cntry2(A).  
  
DATASET ACTIVATE meanout.  
SORT CASES BY cntry2(A).  
  
DATASET ACTIVATE ess1e05_1.  
MATCH FILES /FILE=*  
  /IN=Control_4  
  /TABLE='freqout'  
  /IN=Control_5  
  /TABLE='meanout'  
  /IN=Control_6  
  /BY cntry2.  
EXECUTE.  
  
VARIABLE LABELS Control_4 "Record comes from the original ESS-file" / Control_5 "Record comes from the  
freqout-file" / Control_6 "Record comes from the meanout-file".  
  
* Checking the merge-routine;  
CROSSTABS /TABLES=Control_4 BY Control_5.  
CROSSTABS /TABLES=Control_4 BY Control_6.
```

First, we sort all three datasets (again)

The file receiving the indicators comes first (= ess1e05_1)

Freqout and meanout can be merged to the ESS-dataset in one step. For all datasets, we create a control-variable.

Centering and standardizing

TYPE 2: Centering and standardizing raw variables

Why centering ?

- **Interpretation intercept** = What happens when the independent variables are equal to 0 ?

BUT: The value 0 needs a proper meaning !

Centering gives a meaning to the value of 0 (being: the mean value of that variable).

- **Interpretation interaction-effect** = What happens with the slope of one variable when the other is equal to 0 ?

Why centering ?

Centering gives a meaning to the value of 0

So **ALL** variables in a multilevel analysis (dependent, independent X and independent Z) have to be centered and included as such in the models.

EXCEPTION: Dummies: here the value 0 has already a meaningful interpretation.

Why centering and standardizing ?

- Centering
 - Better interpretation of the intercept.
 - Possible interpretation of the variance components
 - Possible interpretation of interaction-effects
 - Speeds up the estimation of the models
- Standardization
 - Makes parameters comparable

What is centering and standardizing ?

- Centering
 - Subtract the grand mean of a variable from each value.
 - Result: mean = 0
 - Formula: $X_i - \bar{X}$
- Standardizing
 - Subtract the grand mean of a variable from each value and divide by the standard deviation.
 - Result: Mean = 0, Standard deviation = 1
 - Formula:

$$\frac{X_i - \bar{X}}{\sigma}$$

Moeilijkheid in SPSS

- SPSS cannot center automatically
- Function MEAN does not work
 - because MEAN() calculates a mean *over* variables.
 - We need a mean *within* one variable
- SOLUTION: centering by hand
 - Calculate the mean and standard deviation with the AGGREGATE-procedure and save them immediately in your ESS dataset.

Centering and standardizing the country variables

Centering and standardizing the country variables

STEP 1: Calculating the means and standard deviations

```
DATASET ACTIVATE ess1e05_1.
```

AGGREGATE

```
/PRESORTED
```

```
/BREAK=name
```

```
/m1=MEAN(BNP2002)
```

```
/m2=MEAN(BNP2002PPS)
```

```
/m3=MEAN(RomanCatholic)
```

```
/m4=MEAN(RLGDGR_mean)
```

```
/std1=SD(BNP2002)
```

```
/std2=SD(BNP2002PPS)
```

```
/std3=SD(RomanCatholic)
```

```
/std4=SD(RLGDGR_mean).
```

MEAN asks for the mean of this variable.

SD asks for the stan dev of this variable.

* Checking.

```
FREQUENCIES / VARIABLES= m1 m2 m3 m4 std1 std2 std3 std4.
```

REMARK: We use `cntry2` not as the `BREAK`-variable because you want the mean over *all* individuals and countries (= GRAND MEAN centering). That is why we use the constant "name".

Centering and standardizing the country variables

STEP 2: Centering and standardizing

```
* 1.2 Computing the centered and standardised variables.
```

```
*
```

```
COMPUTE bnp_cent = BNP2002 - m1.
```

```
COMPUTE bnppps_cent = BNP2002PPS - m2.
```

```
COMPUTE romkath_cent = percent - m3.
```

```
COMPUTE relig_cent = meanrelig - m4.
```

```
COMPUTE bnp_std = bnp_cent / std1.
```

```
COMPUTE bnppps_std = bnppps_cent / std2.
```

```
COMPUTE romkath_std = romkath_cent / std3.
```

```
COMPUTE relig_std = relig_cent / std4.
```

Here, we center the variables.

Here, we standardize the variables

```
VARIABLE LABELS bnp_cent "BNP 2002 gecentreerd"
```

```
/ bnppps_cent "BNP-PPS 2002 centered"
```

```
/ romkath_cent "Perc. Rooms-Kath. centered"
```

```
/ relig_cent "Mean religiosity centered"
```

```
/ bnp_std "BNP 2002 standardised"
```

```
/ bnppps_std "BNP-PPS 2002 standardised"
```

```
/ romkath_std "Perc. Roman Catholics standardised"
```

```
/ relig_std "Mean religiosity standardised".
```

To finish, we give each new variable a variable label.

FREQUENCIES

```
/ VARIABLES= bnp_cent bnppps_cent romkath_cent relig_cent bnp_std bnppps_std romkath_std relig_std.
```

Centering and standardizing the individual variables

Centering and standardizing the individual variables

STEP 1: Calculating the means and standard deviations

```
DATASET ACTIVATE ess1e05_1.
```

AGGREGATE

```
/PRESORTED
```

```
/BREAK=name
```

```
/m5=MEAN(hinctnt)
```

```
/m6=MEAN(geschlcht)
```

```
/m7=MEAN(edulvl)
```

```
/std5=SD(hinctnt)
```

```
/std6=SD(geschlcht)
```

```
/std7=SD(edulvl).
```

MEAN asks for the mean of this variable.

SD asks for the stan dev of this variable.

* Checking.

```
FREQUENCIES / VARIABLES= m5 m6 m7 std5 std6 std7.
```

REMARK: We use `cntry2` not as the BREAK-variable because you want the mean over *all* individuals and countries (= GRAND MEAN centering). That is why we use the constant "name".

Centering and standardizing the individual variables

STEP 2: Centering and standardizing

- 2.1 Computing the means and standard deviations of income, gender and education with AGGREGATE
- *

```
COMPUTE ink_centr = hinctnt - m5.  
COMPUTE gesl_centr = geslacht - m6.  
COMPUTE opl_centr = edulvl - m7.  
COMPUTE ink_std = ink_centr / std5.  
COMPUTE gesl_std = gesl_centr / std6.  
COMPUTE opl_std = opl_centr / std7.
```

Here, we center the variables.

Here, we standardize the variables

```
VARIABLE LABELS ink_centr "Income centered"  
/ gesl_centr "Gender centered"  
/ opl_centr "Education centered"  
/ ink_std "Income standardised"  
/ gesl_std "Gender standardised"  
/ opl_std "Education standardised".
```

To finish, we give each new variable a variable label.

* Checking.

```
FREQUENCIES /VARIABLES= hinctnt edulvl ink_centr gesl_centr opl_centr ink_std gesl_std  
opl_std.
```

Data management for multilevel analysis
